## Table of Contents

Page

1. Introduction ..... 3
2. Student Discipline Selection and Performance ..... 4
2.1 Elementary School to University ..... 4
2.2 University Enrolments and Degrees ..... 20
2.3 International Comparisons ..... 33
2.4 Immigration ..... 37
2.5 Researchers and Scholarly Output ..... 39
3. Career Outcomes ..... 44
3.1 Labour Force Participation of Young Graduates (25-34 Years Old) in the NSE ..... 46
3.2 Research Careers ..... 52
3.3 Career Outcomes of Former NSERC Scholarship and Fellowship Recipients ..... 60
4. NSERC Statistics ..... 64
4.1 NSERC Program Statistics ..... 64
4.2 Student Motivation to Pursue a University Education in the NSE ..... 67
4.3 Progression of Women Within NSERC Programs ..... 69
4.4 Retention of First-Time Grantees ..... 71
4.5 Scholarship and Fellowship Holders Going Abroad ..... 71
4.6 Prestigious NSERC Awards ..... 73
4.7 Committee Membership ..... 74
5. Conclusion ..... 75

## List of Tables

Page
2.1 Major International and National Learning Assessment Studies ..... 6
2.2 Various Mathematics Test Results by Sex ..... 10
2.3 Canadian 15-Year-Old Boys' and Girls' Self-Beliefs and Engagement in Relation to Math—PISA 2012 ..... 11
2.4 Canadian 15-Year-Old Boys' and Girls' Drive and Motivation Toward Math—PISA 201211 ..... 12
2.5 Various Science Test Results by Sex ..... 14
2.6 Canadian 15-Year-Old Boys' and Girls' Performance on the Science Sub-Scale—PISA 2006 ..... 15
2.7 Canadian 15-Year-Old Boys' and Girls' Engagement in and Motivation Toward Science—PISA 2006 ..... 16
2.8 Number of Students with Credit Attainment for Grade 12, Secondary 5, or Cégep Science and Math Exams ..... 18
2.9 Bachelor's Enrolment (Full-Time) in the Natural Sciences and Engineering1 2005-2014. ..... 24
2.10 Master's Enrolment (Full-Time) in the Natural Sciences and Engineering1 2005-2014 ..... 29
2.11 Doctoral Enrolment (Full-Time) in the Natural Sciences and Engineering1 2005-2014 ..... 30
2.12 Degrees1 Granted in the Natural Sciences and Engineering2, 2005-2014 ..... 32
2.13 First University Degrees in the NSE and Ratio to Population 20 to 24 Years Old, by Sex, for OECD Member Countries-2012 or Most Recent Year. ..... 34
2.14 Doctoral Degrees in the NSE and Ratio to Population 30 to 34 Years Old, by Sex for OECD Member Countries- 2012 or Most Recent Year ..... 36
2.15 Immigration to Canada by Education Level and Occupation, 1980-2014 Skilled Immigrant Classification (Applicant- Female), Professional Occupations in the Natural and Applied Sciences ..... 38
2.16 Number of Researchers, Scholarly Output, Citation Impact and Collaboration for Selected Countries/Regions, 1996- 2000 vs. 2011-2015, by Sex ..... 41
2.17 Number of Researchers by Discipline and Sex for Canada, 1996-2000 vs. 2011-2015 ..... 43
3.1 Labour Force Participation in 2011 by Sex, Ages 25-34, by Major Field of Study and Degree Level ..... 47
3.2 Occupations of Bachelor Graduates (25-34 Years Old) in the NSE, 2011 ..... 50
3.4 Occupations of Doctoral Graduates (25-34 Years Old) in the NSE, 2011 ..... 51
3.5 Median Earnings of Full-Time, Full-Year Employed University Graduates, by Major Occupational Groups, 2010 ..... 52
3.6 Full-Time Faculty in Positions of Full Professor, Associate Professor and Assistant Professor in the NSE, 2000-01 to 2010-11 ..... 54
3.7 Professional Personnel Engaged in R\&D in Industry, by Degree Level, 2009-2013 ..... 57
3.8 Number of Business Enterprise Research and Development Personnel—By Field of Science or Technology, 2013 ..... 58
4.1 Number of NSERC Awards Held by Women, Various Programs ..... 65
4.2 Success Rates by Sex, Various Programs ..... 65
4.3 Results from NSERC's Undergraduate Student Research Award (USRA) Exit Survey, 2005-2014 ..... 68
4.4 Results from NSERC's Postgraduate Scholarship Exit Surveys, 2005-2014 ..... 68
4.5 Results from NSERC's Postdoctoral Fellowship Exit Surveys, 2005-2014. ..... 69
4.6 NSERC Grant Selection Committee Membership by Sex, 2016 ..... 74

## List of Figures

2.1 The Canadian Science and Engineering Supply Chain ..... 4
2.2 Number of Students Enrolled, or Writing Provincial Exams for Grade 12, Secondary 5 and Cégep, 2013 ..... 17
2.3 Full-Time Bachelor's Enrolment, 2005-2014 ..... 21
2.4 Full-Time Female Bachelor's Enrolment by Discipline, 2014-15 ..... 21
2.5 Full-Time Male Bachelor's Enrolment by Discipline, 2014-15 ..... 22
2.6 Full-Time Bachelor's Enrolment by Discipline—Female/Male Ratio, 2014-15 ..... 22
2.7 Full-Time Bachelor's Enrolment ${ }^{1}$ in the Natural Sciences and Engineering, 2005-2014 ..... 23
2.8 Percentage of Full-Time Undergraduates Who Choose to Study the NSE—by Sex and Immigration Status, 2005-2014 ..... 23
2.9 Full-time Master's Enrolment in the Natural Sciences and Engineering, 2005-2014 ..... 26
2.10 Percentage of Full-Time Master's Students Who Choose an NSE Program—by Sex and Immigration Status, 2005- 2014 ..... 26
2.11 Full-time Doctoral Enrolment in the Natural Sciences and Engineering, 2005-2014 ..... 27
2.12 Percentage of Full-Time Doctoral Students Who Choose an NSE Program—by Sex and Immigation Status, 2005- 2014 ..... 27
2.13 Canadian and International Female Students' Enrolment in the NSE Disciplines ..... 28
2.14 Degrees Granted to Female Students in the Natural Sciences and Engineering as a Percentage of Total Granted in the NSE—by Degree Level, 2005-2014 ..... 31
2.15 Degrees Granted to Female Students in the NSE in 2005 and 2014—by Major Disciplines and Degree Level ..... 33
2.16 Ratio of Natural Sciences and Engineering First Degrees to Female Population 20 to 24 Years Old, by Country, 2012 ... 35
2.17 Ratio of Natural Sciences and Engineering Doctoral Degrees to Female Population 30 to 34 Years Old, by Country, 2012 ..... 35
2.18 Skilled Female Immigrants to Canada with NSE Degrees versus Degrees Granted to Women in Canada in the NSE by Degree Level ..... 37
2.19 Number of Researchers in Canada and their Scholarly Output, 1996-2000 vs. 2011-2015, by Sex ..... 40
3.1 Number of Female Workers (Aged 15 Years and Over) in Natural and Applied Sciences and Related Occupations, 2000-2015 ..... 44
3.2 Workers (Aged 15 years and Over) with Natural Sciences and Related Occupations as a Percentage of Total Occupations—by Sex, 1990-2015 ..... 45
3.3 Unemployment Rate in the Natural and Applied Sciences and Related Occupations (Workers Aged 15 years and Over)—by Sex, 2000-2015 ..... 45
3.4 Labour Force Participation of University Graduates in NSE, Aged 25-34—by Sex, Major Fields of Study and Degree Level-2011 ..... 46
3.5 Occupation Distribution of Bachelor Degree Holders 25 to 34 Years of Age in the NSE—by Sex, 2011 ..... 48
3.6 Occupation Distribution of Master's Degree Holders 25-34 Years Old in the NSE-by Sex, 2011 ..... 49
3.7 Occupation Distribution of Doctoral Degree Holders 25-34 Years Old in the NSE—by Sex, 2011 ..... 49
3.8 Full-Time Female Faculty in the NSE as a Percentage of Total NSE Faculty by Discipline ..... 53
3.9 Full-Time Female Faculty in the NSE as a Percentage of Total NSE Faculty by Rank ..... 55
3.10 Full-time Female Faculty in the NSE as a Percentage of Total NSE Faculty by Discipline and Rank, 2010-2011 ..... 55
3.11 Percentage of Women in the NSE at Various Levels of Education and Academic Careers, 2001-02 and 2010-11 ..... 56
3.13 NSERC Postgraduate Scholarship Career Outcomes (Sector of Employment), 1997-2013 ..... 60
3.14 NSERC Postgraduate Scholarship Career Outcomes (Activities on the Job), 1997-2013 ..... 61
3.15 NSERC Postgraduate Scholarship Career Outcomes (Importance of Training to Career), 1997-2013 ..... 61
3.16 NSERC Postdoctoral Fellowship Career Outcomes (Sector of Employment), 1999-2013 ..... 62
3.17 NSERC Postdoctoral Fellowship Career Outcomes (Activities on the Job), 1999-2013 ..... 62
3.18 NSERC Postdoctoral Fellowship Career Outcomes (Importance of Training to Career), 1999-2013 ..... 63
3.19 NSERC Postdoctoral Fellowship Career Outcomes (Would Encourage a Young Person to Choose Same Career Path), 1999-2013 ..... 63
4.1 Number of Awards Held by Women for Selected NSERC Research Programs, 2015-16 ..... 66
4.2 Number of Scholarships and Fellowships Held by Women for Selected NSERC Programs, 2015-16 ..... 66
4.3 NSERC Awards to Women vs. Benchmarks ..... 67
4.4 Progression of 1998-2002 Cohort of NSERC Postgraduate Scholarship Recipients ..... 70
4.5 Distribution of the 1995-1999 Cohort of New Grantees in Discovery Grants at Assistant Professor Level and Their Latest Position at Either Associate Professor or Full Professor ..... 70
4.6 Percentage of 1995-1999 Cohort of New Grantees in Discovery Grants Who Held a Discovery Grant in Subsequent Years ..... 71
4.7 Number and Percentage of NSERC Postgraduate Scholarships at the Doctoral Level Taken Abroad by Sex ..... 72
4.8 Number and Percentage of NSERC Postdoctoral Fellowships Taken Abroad by Sex ..... 72
4.9 Number of NSERC Steacie Recipients - by Sex, 1978-2015 ..... 73
4.10 Number of Nominations for the NSERC Herzberg Gold Medal by Sex, 2000-2016 ..... 73

## Executive Summary

The under-representation of women ${ }^{1}$ in the various fields of science and engineering has long been recognized as an important issue for the Natural Sciences and Engineering Research Council of Canada (NSERC). In this third instalment in the series on Women in Science and Engineering in Canada, a review of some of the available statistics on women in the natural sciences and engineering (NSE) is presented.

Section 2 of this report summarizes standardized test results in mathematics and science and examines the supply side of women in science and engineering through the education stream and immigration. A number of national and international groups assess the performance of boys and girls through standardized tests of mathematics and science. Canadian boys and girls being assessed at various grade levels tend to perform equally well, and, when statistically significant differences exist, they are typically small.

The number of girls taking exams or obtaining credits in grade $12 /$ secondary 5 and/or cégep (Quebec colleges) in mathematics, science, biology, physics and chemistry is higher than the number of boys by a small margin ( 51 per cent) from 2009-10 to 2013-14. However, this ratio does not hold for young Canadians entering university in NSE disciplines, where the female-to-male distribution at the bachelor's level is 38 per cent to 62 per cent (2014-15). The table below highlights the trends in NSE university enrolments and degrees awarded. For more than two decades now, the number of women enrolled or obtaining degrees in the NSE has grown significantly. While the percentage of women enrolled or obtaining degrees in the NSE has progressed since the early 1990s, recent trends have been flat.

Trends in Female University Enrolments and Degrees Granted in the
Natural Sciences and Engineering in Canada

| Level | \% Female |  |  |  | Number of Females |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1992 | 1999 | 2007 | 2014 | 1992 | 1999 | 2007 | 2014 |
| Enrolment |  |  |  |  |  |  |  |  |
| Bachelor's | 32.1 | 37.5 | 38.6 | 38.0 | 31,563 | 42,933 | 57,033 | 70,329 |
| Master's | 29.4 | 38.7 | 37.5 | 36.5 | 3,806 | 5,706 | 7,908 | 9,768 |
| Doctoral | 20.9 | 29.5 | 30.9 | 31.8 | 2,107 | 2,958 | 5,214 | 7,302 |
| Degrees |  |  |  |  |  |  |  |  |
| Bachelor's | 31.6 | 38.3 | 40.6 | 38.7 | 6,626 | 9,978 | 13,632 | 13,272 |
| Master's | 27.4 | 36.3 | 36.2 | 35.9 | 1,233 | 1,815 | 2,817 | 3,918 |
| Doctoral | 20.2 | 22.9 | 31.3 | 31.3 | 330 | 471 | 762 | 1,101 |

*: Industry research percentage is for 2003.
Section 4 presents an overview of NSERC statistics by sex. The share of NSERC awards given to women typically reflects the distribution of the eligible population. Competition success rates by sex for various NSERC programs are also, on average, equivalent for both sexes. The table below presents data on the share and number of awards held by females for a selected number of NSERC programs.

Trends in Support for Females in Selected NSERC Programs

|  | \% Female |  |  |  |  | Number of Females |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Program | 1995-96 | 2000-01 | 2005-06 | 2010-11 | 2015-16 | 1995-96 | 2000-01 | 2005-06 | 2010-11 | 2015-16 |
| Discovery Grants | 9.3 | 13.4 | 15.6 | 17.7 | 19.9 | 646 | 1,082 | 1,467 | 1,720 | 1,861 |
| Postgraduate Scholarships | 34.0 | 40.5 | 42.8 | 40.0 | 38.9 | 1,065 | 1,220 | 1,691 | 1,751 | 1,154 |
| Postdoctoral Fellowships | 17.3 | 26.1 | 27.8 | 31.2 | 29.4 | 78 | 121 | 145 | 162 | 106 |

While progress has been made in the representation of women in the NSE in universities and in related careers, more attention to improving the situation is still required.

## 1. Introduction

The under-representation of women in the various fields of natural sciences and engineering (NSE) has long been recognized and is of concern to the Natural Sciences and Engineering Research Council of Canada (NSERC). This report presents a review and analysis of some of the available data by sex on Canadians' participation in science and engineering. From pre-university to postgraduation, the participation of girls and women and of boys and men in science and engineering education and careers is highlighted.

Canadians on the whole are highly educated and skilled. Top experts and leaders are staying in Canada, talented people are coming to Canada to study and work, and skilled and educated youth are entering the workforce. ${ }^{2}$ Despite these achievements, women graduating in science, technology, engineering and mathematics (STEM) fields such as physical sciences, computer science, engineering, and mathematics are still a minority. The proportion of women in academic or industrial STEMrelated careers reflects this under-representation among students, particularly when correlated with the proportion of women with advanced degrees. A robust and vibrant science, technology and innovation ecosystem ${ }^{3}$ is critical to Canada's economic prosperity and high quality of life. Science, technology and innovation drive productivity and competitiveness, and generate solutions to health, environmental and societal challenges, which lead to higher living standards and better quality of life. The need to foster the participation of women in science and engineering also arises from growing concerns, such as:

- the shortage of some STEM skills needed for building and maintaining an innovative base,
- the low appeal of science education for a majority of young Canadians, and
- an aging population, as well as retirement of many experienced STEM workers.

This report tracks women's participation in science and engineering in Canada over a 10-year time period. NSERC data up to 2016 are included (where data are available). The report builds on the previous NSERC' report Women in Science and Engineering in Canada - 2010. The data provide insight into the magnitude of the problems along the educational pathway and in the science and engineering workforce, with a focus on research careers and funding in the NSE.

[^1]
## 2. Student Discipline Selection and Performance

### 2.1 Elementary School to University

The production of university graduates in science and engineering begins early on, in elementary school, when children are exposed to and form opinions about mathematics and science. Figure 2.1 presents an approximate cohort analysis of the progression of students from grade 1 to a PhD in the sciences or engineering by sex in Canada. At each step along the education stream, fewer and fewer young people choose to study science or engineering, and the drop-off for girls and women is considerably larger than that for boys and men. The likelihood of a girl enrolled in grade 1 in Canada going on to receive a PhD in the sciences or engineering is approximately 1 in 225 (the odds for a boy are 1 in 117).

Figure 2.1 The Canadian Science and Engineering Supply Chain

Interest in math and science education has spawned a number of international assessments, primarily to gauge students' knowledge of these subjects, but also to learn students' perceptions and attitudes toward studying these subjects. While the international assessments provide a global measure of
whether all children are learning the basics, national assessments complement this measure by monitoring progress within countries towards achieving a wider set of learning outcomes. ${ }^{4}$

## Standardized Test Results by Sex

In Canada, a program of national standardized tests of reading, math and science skills, the PanCanadian Assessment Program (PCAP), is administered every three years to grade 8 students in Canadian provinces and territories. The program was initiated by the Council of Ministers of Education, Canada in 2003, to reflect changes made to the curriculum. Before the PCAP was implemented, a School Achievement Indicators Program (SAIP) had been in place from 1993 to 2004, to assess the performance of 13- and 16-year-old students.

For each administration of PCAP, one of the three domains (reading, math and science) is designated as major and the other two as minor. The major domain has a larger number of assessment items, which enables the reporting of results for subdomains; only overall results are reported for the minor domains. The assessment also includes information on the contexts in which mathematics, reading and writing, and science education take place in Canada's education systems. The context information is collected through questionnaires completed by students, teachers and school principals. Students respond to questions concerning their learning environment and the importance they ascribe to the subject being tested. ${ }^{5}$

At the international level, Canada participates in three studies: Progress in International Reading Literacy Study (PIRLS), Program for International Student Assessment (PISA) and Trends in International Mathematics and Science Study (TIMSS). Table 2.1 gives an overview of these programs. It should be noted that all of Canada participated in TIMSS in 1995 and 1999. In 2003, only Ontario and Quebec participated (as benchmarking participants), while in 2007 these two provinces were joined by Alberta and British Columbia. These international assessments enable Canada to benchmark its performance against other countries. Since each of these studies is designed to serve a different purpose, the results should be considered as different lenses through which to view and better understand students' performance.

| Development Process | Developed by the international experts and PISA Consortium test developers. Test items reviewed by country representatives for cultural bias and relevance to PISA's goals. | TIMSS Science and Math Item Review committee and national research coordinators from participating countries develop frameworks through an iterative process. | PIRLS Reading Development Group and national research coordinators from participating countries update frameworks for each PIRLS administration and reviews test items for cultural bias. | - Frameworks developed by representatives from English \& French language education systems. <br> - Frameworks reviewed and accepted by all participating jurisdictions as the basis for developing test items. |

## Performance in Mathematics

The test score results in Table 2.2 show that boys tend to have slightly higher scores than girls in some provinces and some grades, both at the level of formal mathematical knowledge (TIMSS-based results) and at the level of applied mathematics (PISA-based results). PISA results from 2003 to 2012 show statistically small significant differences between the performance of 15 -year-old boys and girls in Canada, with the gap being relatively stable over the years.

Both TIMSS-grade 8 and PISA results show that the Canadian scores in mathematics since 2003 (the baseline year when mathematics was the major domain of PISA-2003 study) have declined for both boys and girls, while TIMSS-grade 4 performance has been improving. The national PCAP assessment shows that mathematics achievement in grade 8 has improved slightly in Canada from 2010 (when mathematics was the major domain) to 2013.

The latest PCAP results (PCAP 2013) show that boys and girls in grade 8 had similar performance overall in Canada. This is consistent with the grade 8 results of the three benchmarking provinces that participated in TIMSS 2011. On the other hand, the Canadian results for 15-year-old students reported in the latest PISA study (2012) still indicate a small difference, with boys scoring slightly higher than girls. While TIMSS assessment is curriculum-based and focuses on assessing formal mathematical knowledge, PISA is skills-based, and emphasizes the application of mathematics in the real world. Although there are differences between the mathematics frameworks of these assessments, a comparison of results of these two studies serves to highlight that gender differences are not straightforward and that deeper exploration is required in order to identify strategies to promote learning equity. ${ }^{8}$

PISA also surveyed students' self-beliefs and participation in mathematics-related activities as well as their drive and motivation toward the discipline. These measurements are made at an important and formative time of an adolescent's life and can provide some insight into the patterns of behaviour that may develop. ${ }^{9}$ In addition to the difference in mathematics performance, there were marked differences (Table 2.3 and 2.4) between males and females in their level of interest in and enjoyment of mathematics as well in their self-related beliefs and emotions in relation to mathematics. The following is an extract from the report of the Canadian results (PISA 2003), which summarizes those findings:

Students' mathematics confidence, their perceived abilities in mathematics, and their beliefs in the value of mathematics for future work and education may have an important impact on their course selections, educational pathways and career choices. Differences exist between the mathematics engagement of Canadian boys and girls. For example, after controlling for mathematics performance, girls reported lower levels of confidence in their ability to solve specific mathematical problems, lower levels of their perceived ability to learn mathematics and higher levels of anxiety in dealing with mathematics. Girls were also less likely to believe that mathematics will be useful for

[^4]their future employment and education and were more likely to report lower levels of interest and enjoyment in mathematics. ${ }^{10}$

[^5]Table 2.2 Various Mathematics Test Results by Sex

| Program | Year | Location | Grade/Age | Males Average Score | Females Average Score | Statistically Different Yes (Y) No (N) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | I will learn many things in mathematics that will help me get a job | 81.2 | (0.7) | 76.8 | (0.8) | 4.4 | (1.1) |

[^7]
## Performance in Science

Trends in test score results in science (Table 2.5) indicate that, in the national test (PCAP), grade 8 girls have had slightly higher scores than boys throughout the last three studies. In the TIMSS study, boys were more likely to score slightly higher than girls in grade 8 as compared with grade 4 . PISA overall results for science indicate smaller differences in performance between boys and girls as compared with mathematics results.

To gain insight into differences in science performance of 15 -year-old boys and girls, the PISA 2006 study, in which science was the major domain, was used. In addition to reporting on combined science performance, PISA 2006 also reported on the following three scientific competencies:

- identifying scientific issues,
- explaining phenomena scientifically, and
- using scientific evidence.

Detailed results of the 2006 PISA assessment indicate that boys and girls performed differently in different areas of science (Table 2.6). Boys had higher scores on scientific knowledge, whereas girls scored higher on the competency of identifying scientific questions that arise from a given situation. In the area of knowledge, boys tended to score higher than girls in the areas of "physical systems" and "earth and space systems." The area of "living systems," however, showed few significant differences in the scores for girls and boys.

PISA 2015 was the second round of the assessment in which science performance was studied in detail; the report, recently released in December 2016 indicates that, in science overall, there was no difference in average achievement scores between 15-year-old boys and girls in Canada.

The level of student engagement is important for acquiring skills and knowledge in science. Students who are engaged in the learning process will tend to learn more and be more receptive to the pursuit of knowledge. Furthermore, student engagement in science has an impact on course selection, educational pathways and career choices. ${ }^{12}$ Based on student responses to a series of questions, PISA 2006 constructed a number of engagement indices. The levels of engagement show that differences exist in the attitudes, confidence and motivation of boys and girls toward science (Table 2.7).

|  | Mean <br> index | SE | Mean index | SE | Difference | SE |
| Self-efficacy in science: measures confidence to perform sciencerelated tasks | 0.30 | (0.02) | 0.13 | (0.02) | 0.17 | (0.02) |
| Self-concept in science: measures their perception of their ability to learn science | 0.42 | (0.02) | 0.12 | (0.02) | 0.30 | (0.03) |
| General value of science: <br> measures their general appreciation of science as important and valuable to society at large | 0.21 | (0.02) | 0.07 | (0.01) | 0.14 | (0.02) |
| Personal value of science: measures their appreciation of science as being relevant and useful for their own purposes | 0.23 | (0.02) | 0.16 | (0.02) | 0.07 | (0.02) |
| General interest in science: refers to interest in learning about broad science topics | 0.10 | (0.02) | 0.12 | (0.01) | -0.02 | (0.02) |
| Enjoyment of science: measures enjoyment in learning and reading about science, solving science problems and acquiring new knowledge in science | 0.22 | (0.02) | 0.13 | (0.02) | 0.09 | (0.02) |
| Instrumental motivation to learn science: measures their belief that science will be useful for future employment or education | 0.28 | (0.02) | 0.36 | (0.02) | -0.08 | (0.03) |
| Future-oriented motivation to learn science: measures their belief that they will study and work in the field of science as an adult | 0.22 | (0.02) | 0.19 | (0.02) | 0.03 | (0.02) |
| Students' science-related activities: measures the extent to which they participate in activities outside of school | -0.05 | (0.02) | -0.25 | (0.02) | 0.19 | (0.03) |

Note: Data in bold represent statistically significant difference.
Indices were derived based on questions collected through the students' questionnaires. Each index was constructed so that the average score across the OECD countries is 0 and so that two-thirds of the scores are between -1.0 and 1.0 (i.e., a standard deviation of 1). Positive scores on each index are associated with higher levels of attributes being measured, whereas negative scores are associated with lower levels of the attributes being measured.

[^10]
## Secondary School and Cégep Preparedness for University STEM Eligibility

In an attempt to better understand the path students take toward a university education in science or engineering, the number of grade 12 students (including students in secondary 5 and cégep in Quebec) enrolled, or writing provincial exams in science and mathematics for selected provinces, is provided in Table 2.8. These data are depicted in Figure 2.2 and indicate that female students outnumber males in biology, are nearly equally represented in mathematics and chemistry, but are fewer than males in physics. This pattern repeats itself upstream in undergraduate enrolment for the biological sciences and physics, but the high number of females at the high school level in chemistry and mathematics does not translate into similar participation at the undergraduate level. While the overall distribution by sex of science and mathematics students pre-university is nearly equal, at the undergraduate level the distribution by sex is 62 per cent male versus 38 per cent female (2014 data).

In a study investigating gender differences in STEM and computer science programs at universities in Canada, ${ }^{15}$ the author used longitudinal data from the Youth in Transition Survey (YITS) ${ }^{16}$ and PISA to better understand the relationship between mathematical ability and the choice of a STEM university program among men and women. For the YITS, a sample of youth 15 years old were interviewed in 2000 and re-interviewed every two years until they were 25 . The data linked some key educational characteristics measured during adolescence (including PISA tests taken at age 15) with other measures collected in subsequent years, including program choice in university. The study concluded as follows:

For some, aptitude for a particular subject is a factor in university program choice. Although mathematical ability plays a role, it does not explain gender differences in STEM choices. Young women with a high level of mathematical ability are significantly less likely to enter STEM fields than young men, even young men with a lower level of mathematical ability. This suggests that the gender gap in STEMrelated programs is due to other factors. Other possible explanations might include differences in labour market expectations including family and work balance, differences in motivation and interest, and other influences.

### 2.2 University Enrolments and Degrees

University education performs a number of societal functions, including developing human capital; building the knowledge base (through research and knowledge development); and disseminating, using, and maintaining knowledge. Higher education in science and engineering provides the advanced skills needed for a competitive workforce and, particularly in case of graduate science and engineering education, the research capacity necessary for innovation. ${ }^{17}$

In 2014-15, there were a total of 438,660 female students and 335,436 male students enrolled at the bachelor's level in Canada of which 401,733 female students and 295,665 male students were Canadian citizens or permanent residents. As shown in Figure 2.3, the total number of female and male undergraduate students has steadily increased over the decade from 2005 to 2014. Average annual bachelor's enrolment growth rates over the decade 2005-14 were 2.6 per cent for males and 2.0 per cent for females.

Figures 2.4 and 2.5 present the 2014-15 bachelors' level enrolment distribution patterns for female and male students, respectively. Among the NSE disciplines, the life and physical sciences hold the same ranking for both male and female students, whereas fewer female students choose engineering, mathematics and computer science. Figure 2.6 shows that, while women represent a majority of students enrolled in undergraduate programs in Canada, they are not the majority in every program.

The number of males and females enrolled in full-time studies in the NSE has grown in absolute numbers in the past decade as shown in Figure 2.7. After being relatively stable at approximately 38 per cent since 2009, the percentage of women enrolled in the NSE at bachelor's level saw a slight increase from 2013-14 to 2014-15. A closer examination of bachelor enrolment trends for Canadian citizens and permanent residents (Table 2.9 and Figure 2.8) reveals that, after a decline in the percentage of enrolment in the NSE for both sexes before 2009-10, the enrolment has been gradually increasing since then, with the rate of increase being slightly greater for male students.

Source: Statistics Canada

Enrolment trends by sex at the master's level are presented in Figures 2.9 and 2.10 and Table 2.10. While the overall enrolment of female students at the master's level outnumbered male enrolment over the past decade, this has not been the case in the NSE. The percentage of female students at the master's level for the NSE from 2005 to 2014 averaged 37 per cent. From 2005 to 2014, master's enrolment in the NSE increased by 32 per cent for female students compared with a 35 per cent increase for male students.

Enrolment trends by sex at the doctoral level are presented in Figures 2.11 and 2.12 and Table 2.11. In the NSE, the average percentage of female students at the doctoral level was 32 per cent for the 2005-2014 period. Nevertheless, unlike the fluctuations in the NSE trends at the bachelor's and master's levels, the percentage of female students at the doctoral level has been steadily increasing, to reach 34 per cent by 2014-15. From 2005 to 2014, total doctoral NSE enrolment increased by 60 per cent for female students and 38 per cent for male students.

Figures 2.10 and 2.12 also highlight some trends with respect to foreign student enrolment in Canada in the NSE, which has been growing faster for both sexes than Canadian and permanent resident enrolment for the 2005-2014 period at both the master's and doctoral levels. These higher growth rates have translated into a larger share of 2014-15 NSE master's and doctoral enrolment of foreign students for both sexes than ever before.

Figure 2.13 compares the enrolment of Canadians (including permanent residents) and international female students in the NSE disciplines at various degree levels. In general, mathematics and computer science disciplines are not commonly chosen fields of study for women at any degree level. Life and physical science disciplines are the most frequent choices for all women at the bachelor's and doctoral levels. However, among international female students studying in the NSE disciplines, a higher proportion study engineering, mathematics and computer science disciplines compared with Canadian female students (including permanent residents).

The inflow of international students in the NSE provides Canada with a large pool of well-educated individuals with potential to become permanent residents. A Statistics Canada study ${ }^{18}$ reports that almost one-half ( 49 per cent) of international students in the early 2000s cohort who pursued graduate studies obtained permanent residence in Canada in the subsequent 10 years.

## Degrees Granted

Table 2.12 presents the number of degrees awarded in the NSE by sex, while Figure 2.14 indicates the trend in NSE degrees awarded to women from 2004 to 2013. Unfortunately, a breakdown between Canadian citizens and permanent residents, on the one hand, and foreign students, on the other, is not available. The share of degrees awarded in the NSE to female students has remained relatively stable at the bachelor's and master's levels, and has increased slightly at the doctoral level. Figure 2.14 also illustrates the reduction in the share of degrees awarded in the NSE to women at higher degree levels. Figure 2.15 depicts the proportion of degrees granted in the NSE to female students across the various levels of study in the major NSE disciplines in 2005 and 2014. The significant reduction at the doctoral level ultimately affects the number of women continuing to careers in research, as discussed in Section 3.2.

Figure 2.15 Degrees ${ }^{1}$ Granted to Female Students in the NSE in 2005 and 2014—by Major Disciplines and Degree Level

1. Degrees granted to full-time and part-time students.
2. Figures above columns represent percentage of degrees granted to females in each major NSE discipline and at each level of study. Source: Statistics Canada

### 2.3 International Comparisons

The lower number of women than men graduating in the NSE is not a phenomenon unique to Canada. Virtually all countries in the world, to varying levels, have fewer women than men studying in the NSE. Table 2.13 presents the number of first university degrees awarded in 2012 (or most recent year) in the NSE as a percentage of the population 20 to 24 years old of the Organisation for Economic Cooperation and Development (OECD) member countries by sex. Figure 2.16 presents the international rankings for the percentage of the female population 20 to 24 years old who earned a first degree in the NSE in 2012, in which Canada placed 12th among the 34 countries included. In contrast, for the male population, the output of NSE first degrees in Canada for those 20 to 24 years old was relatively lower ranked compared with most of the OECD countries, with Canada ranking 25th (see Table 2.13).

Doctoral attainment for the population 30 to 34 years old in 2012 (or most recent year) is provided in Table 2.14 for 29 OECD member countries for which data were available. In comparison with the bachelor's degrees awarded to women in the NSE, at the higher degree level, Canada's position dropped significantly (Figure 2.17), ranking 22nd among the 29 countries. For doctoral degrees earned by men, Canada had a better performance, moving up into the 17th position (see Table 2.14). Once again, the proportion of women with a doctoral degree is considerably lower than the proporition for men for all countries.

Table 2.13 First University Degrees in the NSE and Ratio to Population 20 to 24 Years Old, by Sex, for OECD Member Countries-2012 or Most Recent Year

| Rank | Country | All fields | NSE | \% NSE | No. of Female 20-24 yearolds | NSE as \% 20-24 yearolds | Country | All fields | NSE | to Males | No. of Male 20-24 yearolds | $\begin{aligned} & \text { NSE as \% } \\ & 20-24 \\ & \text { year-olds } \end{aligned}$ |

[^17]
### 2.4 Immigration

Canada has attracted a large number of highly skilled workers with degrees in the NSE (see Table 2.15). The number of skilled immigrant women coming to Canada with degrees in the NSE peaked in 2001 and has fallen considerably in recent years (see Table 2.15). When comparing developing talent in Canada with attracting people through the immigration stream, skilled female immigrants supplemented female Canadian degree recipients by 13 per cent for the master's level and 10 per cent for the doctoral level in 2013 compared with 31 per cent for both master's and doctoral levels in 2004 (Figure 2.18). Although the number of skilled male immigrants with degrees in the NSE has also decreased substantially, they still outnumber women immigrants with NSE degrees. In 2014, the number of male immigrants with professional qualifications suitable for the NSE was 10,995 compared with 1,352 women. This situation further increases the NSE workforce gender gap for the country.

### 2.5 Researchers and Scholarly Output

In a recent study by journal publisher Elsevier, Gender in the Global Research Landscape, ${ }^{19}$ trends in the number of researchers, their scholarly output and collaborations from a gender perspective were published for a selected number of countries, including Canada.

For the purpose of the study, Elsevier used data from Scopus (https://www.scopus.com/), Elsevier's abstract and citation database of over 62 million documents, along with tools that provide information on first names and gender by country, such as Genderize.io (https://genderize.io/), NamSor sociolinguistic analysis (http://www.namsor.com/), and Wikipedia (https://www.wikipedia.org/) name lists to assign a gender to author profiles with a first name.

The dataset covered 27 subject areas ${ }^{20}$ (including health and social sciences), and comparisons were made across 12 countries and regions and two five-year time periods: 1996-2000 and 2011-2015. Only researchers who were listed as an author on at least one publication (article, review or conference proceedings) within either of the two five-year periods were considered in the analysis. Table 2.16 presents a summary of a number of the indicators in the report. A few of the interesting trends observed over the time periods include the following:

- growth in the number of female researchers was higher than that for men for all countries;
- growth in the scholarly output per researcher was higher for men compared with women for 11 of the 12 countries/regions studied;
- the field-weighted citation impact was similar for both sexes for most countries, including Canada; and
- men collaborate internationally and with industry at a greater rate than women, but the differences over time are shrinking.

Figure 2.19 depicts the results for Canadian male and female researchers in terms of the number of researchers and their scholarly output for the two periods.

Table 2.17 provides a breakdown of male and female researchers in Canada per subject area in the fields of natural sciences and engineering, health sciences, social sciences and humanities, as well as multidisciplinary fields, over the two periods. It shows that, over these time periods, the growth in

[^19]the number of women researchers was higher than that for men for all subject areas. The fields of health sciences and social sciences and humanities had nearly equal gender representation during the 2011-2015 period.

## Notes for Table 2.16:

1. Scopus indexes authors with a unique identifier, the Scopus Author ID. This enables the generation of the Scopus Author Profile which identifies all the papers, affiliations, and citations of an author. Since an author's first name field is not mandatory in Scopus, for the purpose of the study, only author profiles with a full first name were included in the gender assignment exercise. The data in this table is from the subset of "named and gendered researchers," i.e those researchers whose Scopus Author Profile contains a first name, and to whom a country of origin and gender were assigned. The Elsevier study reports that the proportion of gendered Scopus Author Profiles across the comparator countries and regions ranges from $80 \%$ to $96 \%$ for 1996-2000 and $82 \%$ to $95 \%$ for 2011-2015.
2. Researchers are identified as those authors who list an affiliation in a comparator country or region on at least one paper (article, review, or conference proceeding) across the sources included in Scopus.
3. Total number of papers (articles, reviews and conference proceedings) for the period divided by total number of researchers for that period. All analyses make use of "whole" rather than "fractional" counting. For example, if a paper has been co-authored by one author from the United States and one author from the United Kingdom, then the paper counts towards both paper count for United States, as well as the paper count of the United Kingdom.
4. Field-Weighted Citation Impact (FWCI) is an indicator of mean citation impact, and compares the actual number of citations received by a paper with the expected number of citations for papers of the same document type (article, review, or conference proceeding), publication year, and subject area. Where the paper is classified in two or more subject areas, the harmonic mean of the actual and expected citation rates is used. The indicator is therefore always defined with reference to a global baseline of 1.0 and intrinsically accounts for differences in citation accrual over time, differences in citation rates for different document types (e.g., reviews typically attract more citations than research articles), as well as subject-specific differences in citation frequencies overall and overtime and document types. It is one of the most sophisticated indicators in the modern bibliometric toolkit.
5. Co-authorship of research papers between researchers based is widely used as a proxy for collaboration, and international collaborations can be assessed by taking into account the countries listed in the authors' affiliations in each published paper. While whole rather than fractional counting is applied, the count is deduplicated at aggregated levels (for example, across the European Union). In Elsevier's analysis, international collaboration for the European Union means collaboration between one or more researcher(s) with a European Union affiliation co-authoring with one or more researcher(s) outside the European Union.
6. In Scopus, institutions are classified into one of four main sectors (Corporate, Academic, Government, and Medical sectors). In this report, academic-corporate collaboration is analyzed via the proxy of papers whose authors' affiliations belong to both the academic and corporate sectors.
7. Interdisciplinary research combines two or more academic disciplines into one activity (e.g., a research project). Elsevier uses a citation-based approach to measure interdisciplinarity. The basic principle behind their approach is that, if a paper cites others that are "far away"from it in terms of topic and hence position in the overall citation network, it is likely to be interdisciplinary. The Elsevier study uses this methodology to assign an interdisciplinary score to each paper, and then focus on the top $10 \%$ of papers with the highest interdisciplinary scores.
8. Growth from 1996-2000 to 2011-2015.

## 3. Career Outcomes

This section examines the labour force participation and occupations of women and men holding degrees in the NSE. More than 1 million Canadians are employed in an occupation related to the NSE. Figure 3.1 presents the number of women in natural and applied sciences and related occupations, and their share of the total from 2000 to 2015 . Over this 15 -year period, the percentage of women holding NSE-related occupations has increased from 20.9 per cent to 23.2 per cent. Among the population of working women in 2015, 3.8 per cent held an NSE-related position compared with 11.4 per cent for men (see Figure 3.2). Unemployment rates for women and men in NSE occupations are presented in Figure 3.3; the rates for women and men follow a similar pattern.

### 3.1 Labour Force Participation of Young Graduates (25-34 Years Old) in the NSE

Statistics Canada's 2011 National Household Survey captured detailed information about the highest degree earned, the field of study and labour force status of Canadians. Data are presented comparing the labour force participation of young women and men graduating in different major fields of the NSE and at different degree levels (bachelor's, master's and doctoral). The 25-34 age group was selected to provide a better indication of more recent labour force outcomes.

Data from the 2011 survey (Table 3.1 and Figure 3.4) indicate that, in general, young male NSE graduates had a higher participation rate in the labour force compared with young female graduates. The lower labour force participation rates of women eventually translate into fewer women in NSErelated occupations.

Figure 3.4 Labour Force Participation of University Graduates in NSE, Aged 25-34—by Sex, Major Fields of Study and Degree Level-2011

Table 3.1 Labour Force Participation in 2011 by Sex, Ages 25-34, by Major Field of Study and Degree Level

| Major Field of Study | Labour Force Status | Degree Level |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Figures 3.5 to 3.7 present the occupational distributions of male and female workers aged 25 to 34 with bachelor, master's and doctoral degrees in the NSE for the 10 major occupation groups. Tables 3.2 to 3.4 present the same data broken down by the three major NSE fields. Some observed trends include:

- the differences in the occupational distributions for women and men decrease as the degree qualifications increase; and
- men tend to occupy positions more concentrated in the natural and applied sciences at all degree levels.

Source: Statistics Canada-2011 National Household Survey. Catalogue \# 99-012-X2011053

The 2011 National Household Survey provided an insight into the earnings of university graduates in 2010. As shown in Table 3.5, employment earnings were generally higher for men. For example, among graduates employed full-time in NSE-related occupations, the median earnings for men were $\$ 77,531$, compared with $\$ 66,746$ for women.

Table 3.5 Median Earnings of Full-Time, Full-Year Employed University Graduates, by Major Occupational Groups, 2010

|  | Median Income (\$ Cdn.) |  |  |
| :--- | :--- | :--- | :--- |
| Occupation | Women | Men | Ratio |
|  |  |  |  |
| Management | 78,299 | 93,159 | 0.84 |

### 3.2 Research Careers

The careers of NSE graduates in research are of particular interest to NSERC, especially the outcomes for doctoral degree holders. A significant percentage of doctoral degree holders in the NSE are able to secure positions in postsecondary teaching and research.

Data by sector of employment related to research careers are presented, along with the early career outcomes of former NSERC scholarship and fellowship recipients.

## Academic Sector

The most recent Canadian university faculty data available are for the academic year 2010-11 due to the temporary discontinuation of the University and College Academic Staff System annual survey conducted by Statistics Canada. The survey has recently been reinstated, and new data are expected in 2017.

The share of women in NSE disciplines working full-time as full, associate or assistant professors remains low, as shown in Figure 3.8 and Table 3.6. In 2010-11, there were 2,223 female faculty in the NSE, representing 18.3 per cent of the NSE total. Figure 3.8 illustrates the wide variation in the share of full-time professors who are women across the various NSE disciplines. The share of female faculty in 2010 was the lowest in engineering (12.1 per cent), but considerably higher in biological and biomedical sciences ( 26.0 per cent), natural resources and conservation ( 26.0 per cent) and agriculture ( 22.2 per cent).

Figure 3.8 Full-Time Female Faculty in the NSE as a Percentage of Total NSE Faculty by Discipline

An examination of full-time faculty positions by rank (Figure 3.9) indicates that the distribution of women faculty is skewed towards lower-ranking academic positions, such as lecturers/instructors, which fall under the "other" category. In 2010-11, women represented 12.5 per cent of all full professors in the NSE but 28 per cent of those at the assistant professor level. Figure 3.10 illustrates the percentage of female faculty by rank in the NSE and by major discipline.

Figure 3.10 Full-time Female Faculty in the NSE as a Percentage of Total NSE Faculty by Discipline and Rank, 2010-2011

Source: Statistics Canada-University and College Academic Staff Systems (UCASS)

Figure 3.11 presents the percentage of women in the NSE at various stages of university education and academic careers in 2001-02 and 2010-11. Although there has been progress over the last decade, Figure 3.11 illustrates that gender equality among academic faculty is still very distant in the NSE.

Figure 3.11 Percentage of Women in the NSE at Various Levels of Education and Academic Careers, 2001-02 and 2010-11

Gender disparities, discrimination, lack of equity and bias in academia are well documented. A report by the Council of Canadian Academies entitled Strengthening Canada's Research Capacity: The Gender Dimension provides a comprehensive assessment of the factors that influence the university research careers of Canadian women. ${ }^{21}$ The Expert Panel came to the conclusion that "There is no single solution to remedy the under-representation of women in the highest ranks of academic research careers. The issue itself is a multifaceted one that is affected by social, cultural, economic, institutional, and political factors and context."

[^21]
## Private Sector

After the academic sector, Canadian industries hire the largest number of research personnel and the second highest number of doctoral graduates to conduct research. Table 3.7 presents the number (both sexes) of professional personnel engaged in research and development (R\&D) in industry by degree level. The most recent Statistics Canada estimates by sex were in 2003, and these showed female representation of 23.4 per cent at the bachelor's level, 25.9 per cent at the master's level and 21.1 per cent at the doctoral level. These numbers correspond to more recent data for European countries, ${ }^{22}$ where women account for 39 per cent of researchers in the government sector, 37 per cent in higher education and barely 19 per cent in the business sector.

Table 3.7 Professional Personnel Engaged in R\&D in Industry, by Degree Level, 2009-2013

| Year | Bachelors | Masters | Doctorates | Total |
| :---: | :---: | :---: | :---: | :---: |
| 2009 | 57,503 | 13,989 | 6,924 | 78,416 |
| 2010 | 56,522 | 17,014 | 8,126 | 81,662 |
| 2011 | 59,540 | 18,693 | 9,471 | 87,704 |
| 2012 | 56,335 | 17,110 | 9,662 | 83,107 |
| 2013 | 54,650 | 15,385 | 7,996 | 78,031 |

Source: Statistics Canada-Industrial Research \& Development: Intentions-2015
In recent years, Statistics Canada has provided counts of research personnel in Canada by field of science or technology. Table 3.8 presents the number of R\&D personnel by field/technology in 2013. The preponderance of R\&D personnel in such areas as engineering, physical sciences, and mathematics and computer sciences, which typically have large male populations, probably lowers the probability of high female representation in private sector $\mathrm{R} \& \mathrm{D}$ positions.

[^22]Table 3.8 Number of Business Enterprise Research and Development Personnel—By Field of Science or Technology, 2013

| Field | $\mathbf{2 0 1 3}$ |
| :--- | ---: |

## Government Sector

The government sector employs the fewest research personnel overall and the fewest research personnel with a PhD of the three sectors. The federal government is the largest employer of research scientists and engineers in the government sector, far outnumbering its provincial counterparts. There is a lack of data regarding degrees held by government researchers. However, there are data on the distribution by sex of federal government employees by job classification. The number of federal female research scientists and engineers is presented in Figure 3.12. As of 2014, women represented 23.7 per cent of federal research scientists and engineers, a significant improvement from their 13.9 per cent share in 2000.

Figure 3.12 Number of Female Research Scientists and Engineers in the Federal Government, 2000-2014

### 3.3 Career Outcomes of Former NSERC Scholarship and Fellowship Recipients

NSERC conducts surveys of former scholarship holders nine years after their award to collect some basic information on their current career. Figure 3.13 presents the sector of employment for the respondents to the surveys conducted from 1997 to 2013. Overall, a higher percentage of men work in the industrial sector. Figure 3.14 presents the activities on the job, with a higher percentage of men reported working on R\&D and product development. As shown in Figure 3.15, both sexes felt equally appreciative of the training they received as it relates to their careers.

NSERC also surveys former postdoctoral fellowship holders seven years after their award. Survey data from 1999 to 2013 for the sector of employment, job activities and importance of training to their career are presented in Figures 3.16, 3.17 and 3.18. The results indicate that outcomes for males and females are more similar at the postdoctoral level than for postgraduates overall. Figure 3.19 indicates that former female and male NSERC postdoctoral fellowship holders are equally likely to recommend to a young person to follow in their career path.

[^24]
## 4. NSERC Statistics

NSERC is Canada's largest federal government funding agency that promotes and supports research in the natural sciences and engineering. The agency promotes discovery by funding research conducted by postsecondary professors and students, and fosters innovation by encouraging Canadian companies to participate and invest in postsecondary research and training.

In this section, data by sex collected by NSERC for several of its programs are presented on women's participation, success in receiving funding, student motivation to pursue education in the NSE, progression of women within NSERC programs, retention, mobility and nomination for and receipt of prestigious awards.

### 4.1 NSERC Program Statistics

As a major funder of the academic and student communities in the NSE, NSERC's statistics are another source of data for the analysis of trends in the Canadian academic research community.

The number of women receiving NSERC training awards and Discovery Grants (DGs) are presented in Table 4.1. NSERC's funding data by sex follows a pattern similar to the education and academic career data presented in Section 3. Female participation in NSERC's programs decreases from the undergraduate program to the DG program. The number of women awardees in the DG program has increased by 18.3 per cent over the past 10 years (2006-07 to 2015-16).
The rates of success for men and women participating in NSERC's programs with annual competitions are presented in Table 4.2. Generally, there are no significant differences in success rates by sex.

Figure 4.1 presents further details of the proportion of awards held by women for NSERC's major research programs in 2015-16. Female representation is lower in NSERC programs involving industry, which have a large concentration of engineering professors receiving grants. Figure 4.2 presents data for NSERC's major scholarship and fellowship programs, indicating a decline in female representation from the undergraduate to the postdoctoral level and for those programs involving industry.

Figure 4.3 compares NSERC funding with certain population benchmarks, such as student enrolments and faculty numbers in the NSE. The proportion of NSERC funding recipients exceeds the female population levels for student funding overall but is slightly below these levels for women at the postdoctoral and faculty levels.

Table 4.1 Number of NSERC Awards Held by Women, Various Programs

| Fiscal <br> Year | Undergraduate Awards (USRA) |  | Postgraduate Scholarships ${ }^{2}$ |  | Postdoctoral Fellowships |  | Discovery Grants ${ }^{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | (No.) | (\%) ${ }^{1}$ | (No.) | (\%) ${ }^{1}$ | (No.) | (\%) ${ }^{1}$ | (No.) | (\%) ${ }^{1}$ |
| 2006-07 | 1,805 | 44.0\% | 1,676 | 40.8\% | 131 | 27.9\% | 1,573 | 16.0\% |
| 2007-08 | 1,813 | 44.1\% | 1,831 | 40.7\% | 140 | 28.6\% | 1,697 | 16.8\% |
| 2008-09 | 2,210 | 42.5\% | 2,004 | 41.3\% | 144 | 29.9\% | 1,772 | 17.4\% |

### 4.2 Student Motivation to Pursue a University Education in the NSE

NSERC routinely conducts exit surveys of scholarship and fellowship award holders. A number of questions on the surveys are related to activities and/or people that contributed to the individuals' decision to pursue an education in the NSE. Tables 4.6 to 4.8 present women's and men's responses to a variety of statements for Undergraduate Student Research Award (USRA) holders, Postgraduate Scholarship (PGS) winners, and Postdoctoral Fellowship (PDF) recipients. The USRA and PGS exit surveys indicate that women tend to have more encouragement from family, teachers and professors to pursue an NSE education, and more exposure to R\&D activities (science camps and R\&D at the university). At the postdoctoral level there were no significant differences in the responses.

Table 4.3 Results from NSERC's Undergraduate Student Research Award (USRA) Exit Survey, 2005-2014

| Statement | No. Respondents |  | No. Agree with Statement |  | Agree with Statement |  | Statistical Difference |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Male | Female | Male | Female | Male | Female | $\mathrm{Y} / \mathrm{N}$ |
| I am enjoying my undergraduate student life | 11,276 | 9,110 | 8,491 | 7,169 | 75.3 | 78.7 | Y |
| I participated in science camps and/or science fairs during my elementary and/or high school years | 11,276 | 9,110 | 3,112 | 2,922 | 27.6 | 32.1 | Y |
| So far, I have accumulated a high debt during my undergraduate education | 11,276 | 9,110 | 2,385 | 1,916 | 21.2 | 21.0 | N |
| My family encouraged me to pursue undergraduate studies in science/engineering | 11,276 | 9,110 | 4,879 | 4,266 | 43.3 | 46.8 | Y |
| A high school teacher encouraged me to pursue undergraduate studies in science/engineering | 11,276 | 9,110 | 3,757 | 3,479 | 33.3 | 38.2 | Y |
| Graduate studies will be an important element of my career goals | 11,276 | 9,110 | 7,561 | 6,046 | 67.1 | 66.4 | N |
| I would recommend my field of study to others | 11,276 | 9,110 | 7,668 | 6,782 | 68.0 | 74.4 | Y |
| My friends are pursuing graduate degrees | 11,276 | 9,110 | 4,503 | 3,996 | 39.9 | 43.9 | Y |

|  | Male | Female | Male | Female | Male | Female |  |
| I enjoyed my undergraduate student life | 6,814 | 5,554 | 5,005 | 4,229 | 73.5 | 76.1 | Y |
| I was exposed to research during my undergraduate years | 6,814 | 5,553 | 4,735 | 4,232 | 69.5 | 76.2 | Y |
| I accumulated a high debt during my undergraduate degree | 6,814 | 5,553 | 1,039 | 954 | 15.2 | 17.2 | N |
| My friends are pursuing graduate degrees | 6,813 | 5,553 | 2,029 | 1,882 | 29.8 | 33.9 | Y |
| My family encouraged me to pursue graduate studies | 6,813 | 5,553 | 2,595 | 2,442 | 38.1 | 44.0 | Y |
| A professor encouraged me to pursue graduate studies | 6,813 | 5,553 | 4,069 | 3,635 | 59.7 | 65.5 | Y |
| Graduate studies are an important element of my career goals | 6,813 | 5,553 | 5,179 | 4,202 | 76.0 | 75.7 | N |
| I would recommend my field of study to others | 6,813 | 5,553 | 4,197 | 3,589 | 61.6 | 64.6 | Y |
| I would have gone on to or stayed in graduate school even without NSERC support | 6,813 | 5,553 | 3,436 | 3,031 | 50.4 | 54.6 | Y |
| I do not want to go into debt for graduate education | 6,813 | 5,553 | 5,600 | 4,783 | 82.2 | 86.1 | Y |
| It is difficult to find a job in my field without a graduate degree | 6,813 | 5,553 | 2,750 | 2,835 | 40.4 | 51.1 | Y |

Table 4.5 Results from NSERC's Postdoctoral Fellowship Exit Surveys, 2005-2014

| Statement | No. Respondents |  | No. Agree with Statemen |  | Agree | atement | Statistical Difference |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Male | Female | Male | Female | Male | Female | Y/N |
| I enjoyed my undergraduate student life | 743 | 324 | 502 | 217 | 67.6 | 67.0 | N |
| I was exposed to research during my undergraduate years | 743 | 324 | 461 | 231 | 62.0 | 71.3 | N |
| I accumulated a high debt during my undergraduate and postgraduate education | 743 | 324 | 145 | 60 | 19.5 | 18.5 | N |
| My postgraduate experience prepared me well for postdoctoral work | 743 | 324 | 597 | 268 | 80.3 | 82.7 | N |
| A professor encouraged me to pursue a postdoctoral position | 743 | 324 | 465 | 216 | 62.6 | 66.7 | N |
| Postdoctoral work is an important element of my career goals | 743 | 324 | 591 | 250 | 79.5 | 77.2 | N |
| I would recommend my field of study to others | 743 | 324 | 451 | 208 | 60.7 | 64.2 | N |
| I would have taken a postdoctoral experience even without NSERC support | 743 | 324 | 413 | 182 | 55.6 | 56.2 | N |
| It is difficult to find a job in my field without postdoctoral experience | 743 | 324 | 634 | 287 | 85.3 | 88.6 | N |
| I find it is taking a long time to reach my career goals | 743 | 324 | 436 | 169 | 58.7 | 52.2 | N |

### 4.3 Progression of Women Within NSERC Programs

The following section attempts to look at the progression of women within NSERC programs. Figure 4.4 presents the results for a cohort of NSERC scholarship winners from 1998 to 2002 and their subsequent applications for PDF and DGs. A larger percentage of men than of women from the cohort go on to apply for an NSERC PDF or DG, and also obtain a DG. This follows a similar pattern shown in Section 3 on enrolments, degrees and R\&D careers.

An examination of the rank that women and men currently hold after receiving their first DG in 1995 to 1999 was also undertaken. Figure 4.5 presents data for this indicator, which shows that men and women from this cohort have progressed at similar rates.

Figure 4.4 Progression of 1998-2002 Cohort of NSERC Postgraduate Scholarship Recipients ${ }^{1}$

Figure 4.5 Distribution of the 1995-1999 Cohort of New Grantees in Discovery Grants at Assistant Professor Level and Their Latest Position at Either Associate Professor or Full Professor

### 4.4 Retention of First-Time Grantees

Figure 4.6 illustrates the grants held by a cohort of first-time grantees of NSERC's DG program from 1995 to 1999 and their subsequent awards in 2005, 2010 and 2015. A slightly smaller percentage of the female cohort versus the male cohort is still receiving a DG more than 15 years later.

Figure 4.6 Percentage of 1995-1999 Cohort of New Grantees in Discovery Grants Who Held a Discovery Grant in Subsequent Years

### 4.5 Scholarship and Fellowship Holders Going Abroad

Figures 4.7 and 4.8 present the number and percentage of scholarship and fellowship recipients who take their award abroad. At the doctoral level, there is no differences in the percentage of men and women going abroad, while at the postdoctoral level a small difference still exists.

Figure 4.7 Number and Percentage of NSERC Postgraduate Scholarships at the Doctoral Level Taken Abroad by Sex

Figure 4.8 Number and Percentage of NSERC Postdoctoral Fellowships Taken Abroad by Sex

### 4.6 Prestigious NSERC Awards

Figure 4.9 presents the number of female and male winners of the E.W.R. Steacie Memorial Fellowships (Steacie Awards) for the past four decades. The number of women nominated for NSERC's Gerhard Herzberg Canada Gold Medal for Science and Engineering (see Figure 4.10) has not changed appreciably over the past 16 years and remains at very low levels. Three women scientists won prestigious NSERC prizes in 2016: Dr. Victoria Kaspi won the Herzberg Gold Medal, Dr. Barbara Sherwood Lollar won the John C. Polanyi Award, while Dr. Shana Kelley and her team received the Brockhouse Canada Prize for Interdisciplinary Research in Science and Engineering.

Figure 4.9 Number of NSERC Steacie Recipients - by Sex, 1978-2015

Figure 4.10 Number of Nominations for the NSERC Herzberg Gold Medal by Sex, 2000-2016

### 4.7 Committee Membership

Table 4.9 presents the membership of peer review committees by sex for NSERC's largest committees. Female representation is highest in the life sciences.

Table 4.6 NSERC Grant Selection Committee Membership by Sex, 2016

| Committee | No. Females | No. Males | \% Female |
| :--- | ---: | ---: | ---: |
|  |  |  |  |
| Discovery Grants | 24 | 41 | $37 \%$ |
| Genes, Cells and Molecules | 17 | 39 | $30 \%$ |
| Biological Systems and Functions | 6 | 17 | $26 \%$ |
| Evolution and Ecology | 4 | 21 | $16 \%$ |
| Chemistry | 6 | 29 | $17 \%$ |
| Physics | 5 | 22 | $19 \%$ |
| Geosciences | 9 | 34 | $21 \%$ |
| Computer Science | 11 | 20 | $35 \%$ |
| Mathematics and Statistics | 5 | 27 | $16 \%$ |
| Civil, Industrial and Systems Engineering | 6 | 26 | $19 \%$ |
| Electrical and Computer Engineering | 5 | 19 | $21 \%$ |
| Materials and Chemical Engineering | 5 | 19 | $21 \%$ |
| Mechanical Engineering | 103 | 314 | $25 \%$ |
| Total |  |  |  |
|  | 35 | 61 | $36 \%$ |
| Scholarships and Fellowships |  |  |  |
| Strategic Project Panels | 12 | 33 | $27 \%$ |

## 5. Conclusion

Although enrolment by women in university education has increased in Canada over the last decade, the proportion of women students in the various STEM fields has not seen substantial change.

Our data indicate that, although the number of female and male students who could enrol in undergraduate science and engineering programs is similar, the sharpest drop in girl's and women's STEM studies occurs right after high school. While there are numerous outreach programs, encouraging girls to follow their interests and pursue STEM fields further after high school is still a hurdle.

According to Dr. Tamara Franz-Odendaal, the Atlantic regional Chair for NSERC's program for Women in Science and Engineering, early engagement (before high school) is a key factor in guiding girls into science careers. In surveying students in grades 7 through 9, Dr. Franz-Odendaal and her team found that girls who engaged in activities such as science fairs, competitions and engineering summer camps were 2.7 times more likely to consider a STEM career. ${ }^{23}$

As a federal funding agency, NSERC plays a role in increasing the inclusion of women in the NSE in Canada. Increasing investments in programs such as PromoScience, CREATE and Chairs for Women in Science and Engineering and policy changes will extend our reach and help attract more girls and women to the NSE.

[^26]
[^0]:    ${ }^{1}$ In this report, women or girls generally refer to people who self-identify as women. However, in the statistics used and cited throughtout, women or female refer to biological sex rather than self-identified sex, as the statistics were gathered on this basis.
